

# Clam Shell Blower Packages

Built with the highest level of **Quality** and **Reliability** available.

*Superior noise levels are achieved through a combination of design elements. Proper blower selection, premium quality silencers, and sound reduction enclosure deliver a very quiet package.*

The “Clam Shell” series is a family of PD blower packages from 3 to 20 HP with pressures to 15 PSI. The enclosure design makes service access fast with quick release latches and easy to lift top half. The weather proof design means it can be installed outdoors.

A “clam shell” style sound attenuating enclosure constructed of sheet metal completely encases the blower package. A fully retractable hinged top allows fast easy service access to the motor, blower and drive.

Steel panels provide a barrier to the noise and are lined with 1” acoustic grade open cell foam for absorbing and dissipating the noise energy. A gasket trim provides a tight seal where the top and bottom halves meet secured with two flexible draw latches. The blower draws air through a louvered inlet opening, designed to provide proper air flow for cooling the enclosure. The panel mounted instrument group includes outlet pressure, discharge temperature, and inlet filter gauges.
